

Andrew Nee, Senior Software Engineer (Go, TypeScript)

📍 Tashkent ✉ ndrewnee@gmail.com 📞 +998917710028 ✈ ndrewnee 🔗 LinkedIn 🐙 GitHub

SUMMARY

- Senior Software Engineer with 10+ years of experience building distributed backend systems and fullstack applications in Go and TypeScript.
- Specialized in distributed systems, AI-powered real-time applications, and scalable backend architecture.
- Experience includes crypto exchanges, healthcare SaaS, and real-time communications platforms with AI-powered features.

SKILLS

Languages: Go, TypeScript

Databases & Messaging: PostgreSQL, MongoDB, Redis, RabbitMQ, AWS SQS

Infrastructure: Kubernetes, Docker, AWS, Prometheus, Grafana, Loki

AI: OpenAI APIs, Real-time AI Pipelines (STT → LLM → TTS), Audio/Voice Processing

Frontend: React, Vite, Telegram Mini Apps

EXPERIENCE

Senior Software Engineer

Jul 2025 - Present

Virtuoso Hub - Real-time communications platform

- Architected and delivered the core real-time AI pipeline (STT → LLM → TTS) in Go, powering AI features for the company's real-time communications platform.
- Developed a real-time AI moderation system to analyze voice streams, detecting and flagging unsafe content to ensure platform safety and policy compliance.
- Engineered a Go and GStreamer-based media recording service to transcode WebRTC streams into HLS for scalable VOD playback.
- Improved reliability of real-time media services during platform launch through Kubernetes infrastructure optimization and production monitoring (Prometheus, Grafana).

Senior Software Engineer

Feb 2023 - Jul 2025

Haqqex - Centralized crypto exchange

- Architected and led development of a high-load trading engine, improving order processing scalability by redesigning core matching logic and implementing data partitioning.
- Built high-load TypeScript services for the exchange's primary liquidity bridge, integrating KuCoin and OKX broker APIs for reliable real-time trade execution.
- Designed and deployed resilient WebSocket pipelines delivering real-time market data for 200+ trading pairs on a platform serving over 1M registered users.

Medesk - Healthcare SaaS platform

- Improved backend scalability and reliability by optimizing Go and TypeScript services and data layer, supporting platform growth from 60 to 3,000+ clinics.
- Led the data layer redesign, migrating from Neo4j and Elasticsearch to PostgreSQL, reducing infrastructure costs by tens of thousands of dollars annually.
- Delivered a business analytics module that provided key growth insights, directly contributing to scaling the customer base past the 1,000-clinic milestone.
- Automated integrations with 8+ external laboratory APIs, creating a pipeline that reliably processed millions of patient lab results and eliminated hours of manual data entry.

Newmax Technologies - Ride-hailing platform (Uber-like)

- Refactored a critical Go microservice for real-time ride dispatching, which eliminated a source of frequent production crashes and stabilized the service.
- Reduced client wait time from several minutes to under 30 seconds by re-architecting the driver-rider matching algorithm to handle parallel requests.

English - C1

Russian - Native

EDUCATION

PROJECTS

- Built a fintech cashback platform as a Telegram Mini App, owning both the Go backend and React frontend.
- Designed PostgreSQL schema and transaction processing logic with a focus on consistency and correctness.
- Integrated government tax APIs for receipt-based purchase validation.

- Built a B2B loyalty platform as a Telegram Mini App with separate customer and business interfaces.
- Designed and implemented a multi-tenant backend in Go and PostgreSQL for reward tracking and campaign management.
