

Andrew Nee, Senior Software Engineer (AI Systems, Go)

📍 Tashkent ✉ ndrewnee@gmail.com 📞 +998917710028 📧 ndrewnee 🔗 LinkedIn 🐙 GitHub

SUMMARY

- Senior Software Engineer with 10+ years of experience in Go, specializing in real-time AI systems and LLM-powered applications.
- Built production voice AI agents and real-time pipelines (STT → LLM → TTS) in Go using OpenAI APIs, enabling AI-powered voice interactions.
- Architected a crypto trading engine, designing core matching and execution components.
- Redesigned the data layer in a healthcare SaaS platform (Neo4j/Elasticsearch → PostgreSQL), reducing infrastructure costs by tens of thousands of dollars annually.

SKILLS

Languages: Go, TypeScript

AI: LLM APIs (OpenAI), STT → LLM → TTS Pipelines, Voice Agents, AI Moderation

Databases & Messaging: PostgreSQL, MongoDB, Redis, RabbitMQ, AWS SQS

DevOps & Cloud: Kubernetes, Docker, AWS, Prometheus, Grafana, Loki

EXPERIENCE

Senior Software Engineer Jul 2025 - Present

Virtuoso Hub - AI communications platform

- Architected and delivered the core real-time AI pipeline (STT-LLM-TTS) in Go, taking the company's flagship voice agent from concept to production.
- Developed a real-time AI moderation system to analyze voice streams, detecting and flagging unsafe content to ensure platform safety and policy compliance.
- Engineered a Go and GStreamer-based recording service to transcode WebRTC streams to HLS, enabling a critical VOD playback feature for customers.
- Maintained 99.9% uptime for real-time media services during the platform's initial launch by leading Kubernetes deployment optimization and monitoring (Prometheus, Grafana).

Senior Software Engineer Feb 2023 - Jul 2025

Haqqex - Centralized crypto exchange

- Architected and led the development of a high-load trading engine, scaling order processing capacity 10x by redesigning the core matching logic and implementing data partitioning.
- Engineered the primary liquidity bridge by integrating with KuCoin and OKX broker APIs, enabling reliable, real-time trade execution across the exchange.
- Delivered real-time market data for 200+ trading pairs to over 1M registered users by designing and deploying resilient WebSocket pipelines.

Medesk - Healthcare SaaS platform

- Improved backend scalability and reliability by optimizing core services and data layer, supporting platform growth from 60 to 3,000+ clinics.
- Led the data layer redesign, migrating from Neo4j and Elasticsearch to PostgreSQL, which cut annual infrastructure costs by tens of thousands of dollars annually.
- Delivered a business analytics module that provided key growth insights, directly contributing to scaling the customer base past the 1,000-clinic milestone.
- Automated integrations with 8+ external laboratory APIs, creating a pipeline that reliably processed millions of patient lab results and eliminated hours of manual data entry.

Newmax Technologies - Ride-hailing platform (Uber-like)

- Refactored a critical Go microservice for real-time ride dispatching, which eliminated a source of frequent production crashes and stabilized the service.
- Reduced average client wait time from 5 minutes to under 30 seconds by re-architecting the driver-rider matching algorithm to handle parallel requests.

LANGUAGES

English - C1

Russian - Native

EDUCATION

Bachelor of Computer Software Engineering2012 - 2016

Tashkent University of Information Technologies

PROJECTS

- Built a fintech cashback platform from scratch as a Telegram Mini App, with full ownership of the Go backend and React frontend.
- Designed the database schema and transaction processing logic in PostgreSQL, focusing on data consistency and correctness.
- Integrated with government tax API for receipt-based purchase validation.

- Built an end-to-end B2B loyalty platform as a Telegram Mini App, including separate interfaces for customers and businesses.
- Designed and implemented a multi-tenant backend in Go and PostgreSQL for reward tracking and campaign management.
